WAYPOINT

SURFACE SCOUT / CONCEPT BOOK

One small robot for two worlds.

01 / MOON LANDER EGRESS

02 / MARS BEACON SERVICE

One body for every job

Front, side and back of the standard Waypoint. The tool mount and power pack are shared across the fleet.

FRONT

Recessed optics and a clean oval head

PROFILE

Covered joints and a wrist tool mount

REAR

Lift handle and removable power pack

A little machine with manners

The body is slim, the shell feels hand sculpted, and the personality comes from motion.

TWO OPTICAL POINTS

A small head tilt can read as curiosity through the copper glass. A still head and squared stance read as ready.

LUNAR EGRESS STUDY

ONE SHARED SERVICE PACK

The teal cassette and wrist mount stay the same. A worker picks up the tool it needs at the dock.

01 / PLANT

The wide boot finds the surface.

02 / PITCH

The head catches up a beat late.

03 / CATCH

The arms make one small correction.

04 / RESET

The scout stands ready again.

From crate to outpost

Launch in a restrained cargo rack. After landing, the first job is making a route the rest of the fleet can use.

MOON

Step out and mark the route

Waypoint rides in the lander, wakes at the dock, then places markers along a short route. Covered joints and replaceable tread suggest how it handles abrasive regolith. The dock gives it a protected place to recharge and ride out temperature extremes.

MARS

Bring the next station online

The same chassis carries a beacon or inspection tool. It can check a latch, report a fault, and return to a sheltered dock. Dust protection and a conservative return rule matter when visibility or available power drops.

OUTPOST LOOP

01 UNLATCH
Wake in the lander.

02 SURVEY
Walk the short route.

03 SET UP
Place a marker or relay.

04 RETURN
Dock, recharge and report.

DESIGN INTENT

The humanoid shape earns its place near ramps, handles and service panels. A rover or cargo rail moves heavy loads. The art proposes a surface workflow; flight, dust, thermal and power performance would need engineering and testing.
